# SCALE FOR PROJECT ABSTRACT VM (/PROJECTS/ABSTRACT-VM)

vogsphere@vogsphere-2.unit.ua:intra/2018/activities/abstract\_v ☐

### Introduction

Please respect the following rules:

- Remain polite, courteous, respectful and constructive throughout the correction process. The well-being of the community depends on it.
- Identify with the person (or the group) graded the eventual dysfunctions of the work. Take the time to discuss and debate the problems you have identified.
- You must consider that there might be some difference in how your peers might have understood the project's instructions and the scope of its functionalities. Always keep an open mind and grade him/her as honestly as possible. The pedagogy is valid only and only if peer-evaluation is conducted seriously.

### Guidelines

- Only grade the work that is in the student or group's GiT repository.
- Double-check that the GiT repository belongs to the student or the group. Ensure that the work is for the relevant project and also check that "git clone" is used in an empty folder.
- Check carefully that no malicious aliases was used to fool you and make you evaluate something other than the content of the official repository.
- To avoid any surprises, carefully check that both the correcting and the corrected students have reviewed the possible scripts used to facilitate the grading.
- If the correcting student has not completed that particular project yet, it is mandatory for this student to read the entire subject prior to starting the defence.
- Use the flags available on this scale to signal an empty repository, non-functioning program, a norm error, cheating etc. In these cases, the grading is over and the final grade is 0 (or -42 in case of

cheating). However, with the exception of cheating, you are encouraged to continue to discuss your work (even if you have not finished it) in order to identify any issues that may have caused this failure and avoid repeating the same mistake in the future.

### **Attachments**

Subject (/uploads/document/document/72/abstract-vm.en.pdf)

## **Preliminaries**

#### **Preliminaries tests**

Check firstly the following elements:

- There is something in the git repository.
- No cheating (All functions are authorised, the student can explain the code,  $\ldots$

If an element isn't implemented as explained in the subject, the grading ends. Use the appropriate flag. You're allowed to debate some more.

## Feature's testing

#### Test 1

Run the following program:

push int32(42) push int32(33) add ;poney push float(44.55) mul push double(42.42) ;commentaire de ouf push int32(42) dump pop assert double(42.42)

Does the program execute properly?

✓ Yes

 $\times$ No

#### Test 2

Run the following program:

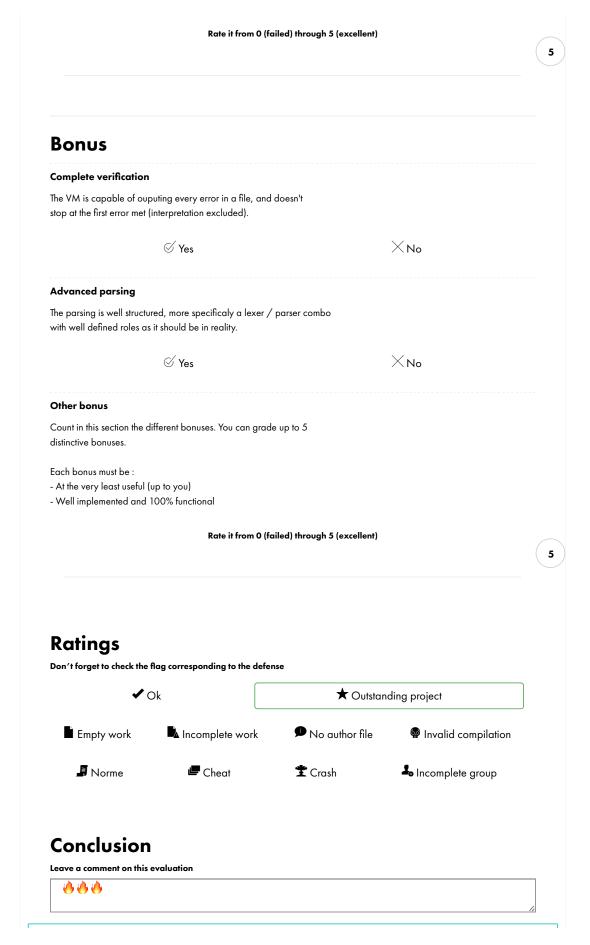

push int32(32) push int32(0) div

Does the program sto	ps properly because of the 0 division?		
		×No	
Test 3			
Run the following prog	gram:		
push int16(9999999 exit	99999999999999999)		
Does the program sto	ps properly because of the overflow error?		
	⊗ Yes	×N₀	
Test 4			
Run the following pro	gram:		
push int16(32;) pu int(32)) exit			
Does the program sto	ps properly because of a syntax error?		
	⊗ Yes	imesNo	
Test 5			
Run the following prog	gram:		
рор			
exit			
Does the program sto	ps properly because of an empty stack?		
		×No	
Test 6			
Run the following pro	gram:		
push int32(42) assert int32(0) exit			
Does the program sto	ps properly on an assert error?		
	⊗ Yes	imesNo	
Test 7			
Run the following pro	gram:		

Does the program stops properly on a missing operand?	
⊗ Yes	imesNo
T	
Test 8	
Run the following program:	
push int8(33);!	
push int8(112);p	
push int8(111);o	
push int8(108);1	
push int8(112);p	
print	
рор	
print	
pop	
print	
pop	
print	
pop	
print	
pop exit

Implementation	
Inputs	
The VM must be able to read either from a file or from the standard input (with a $;;$ to end the input)	
✓ Yes	imesNo
Stack	
The VM countains a "stack". It can't be a std::stack except if rigorously justified (std::stack isn't iterable, it can at best be used as a base class).	
	$ imes_{No}$
Polymorphic operands	
Are operand manipulated polymorphicaly through IOperand *. If not, the project is off topic. Click on the "crash" flag, the grading stops but you're allowed to debate some more.	
	imesNo
Operand factory	
There must be an operand "factory" implementing the following function:	
IOperand * SomeClass::createOperand(eOperandType type, const std::string	g & value);
∀es	×N₀
Precision management	
The VM manages precision in a non trivial way - An if forest or any other disgusting thing. An enum is totally acceptable for example.	
	imesNo
Parser	
The VM has a clean and clomplete parsing?	
	imesNo
Exceptions	
The VM must use exceptions to manage errors.	
Select the corresponding grade:  - No exceptions: 0  - Scalar exceptions (string, char*, int,): 1  - Use of pre-made exceptions (only std::exception ou autre): 2  - Use of custom exceptions custom inheriting from std::exception: 3  - Use of custom exceptions custom inheriting from a more specific class than std::exception: 4
